

AGR18045E

45 W, 1.805 GHz—1.880 GHz, LDMOS RF Power Transistor

Introduction

The AGR18045E is a high-voltage, gold-metallized, laterally diffused metal oxide semiconductor (LDMOS) RF power field effect transistor (FET) suitable for global system for mobile communication (GSM), enhanced data for global evolution (EDGE), and multicarrier class AB power amplifier applications. This device is manufactured using advanced LDMOS technology offering state-of-the-art performance and reliability. It is packaged in an industry-standard package and is capable of delivering a minimum output power of 45 W, which makes it ideally suited for today's RF power amplifier applications.

Features

Typical performance ratings for GSM EDGE (f = 1.840 GHz, P_{OUT} = 15 W)

- Error vector magnitude (EVM): 1.9%
- Power gain: 15 dB
- Drain efficiency: 32%
- Modulation spectrum:
 - @ ±400 kHz = -63 dBc.
 - @ ±600 kHz = -73 dBc.

Typical continuous wave (CW) performance over entire digital communication system (DCS) band:

- P1dB: 49 W typical (typ).
- Power gain: @ P1dB = 14 dB.
- Efficiency: @ P1dB = 53% typ.
- Return loss: -12 dB.

High-reliability, gold-metallization process.

Low hot carrier injection (HCI) induced bias drift over 20 years.

Internally matched.

High gain, efficiency, and linearity.

Integrated ESD protection.

45 W minimum output power.

Device can withstand 10:1 voltage standing wave ratio (VSWR) at 26 Vdc, 1.840 GHz, 45 W CW output power.

Large signal impedance parameters available.

Table 1. Thermal Characteristics

Parameter	Sym	Value	Unit
Thermal Resistance, Junction to Case	R _{JC}	1.5	°C/W

Table 2. Absolute Maximum Ratings*

Parameter	Sym	Value	Unit
Drain-source Voltage	V _{DSS}	65	Vdc
Gate-source Voltage	V _{GS}	-0.5, 15	Vdc
Drain Current Continuous	I _D		Adc
Total Dissipation at T _C = 25 °C	P _D	115	W
Derate Above 25 °C	—	0.67	W/°C
Operating Junction Temperature	T _J	200	°C
Storage Temperature Range	T _{STG}	-65, 150	°C

* Stresses in excess of the absolute maximum ratings can cause permanent damage to the device. These are absolute stress ratings only. Functional operation of the device is not implied at these or any other conditions in excess of those given in the operational sections of the data sheet. Exposure to absolute maximum ratings for extended periods can adversely affect device reliability.

Table 3. ESD Rating*

AGR18045E	Minimum (V)	Class
HBM	500	1B
MM	50	A
CDM	1500	4

* Although electrostatic discharge (ESD) protection circuitry has been designed into this device, proper precautions must be taken to avoid exposure to ESD and electrical overstress (EOS) during all handling, assembly, and test operations. PEAK Devices employs a human-body model (HBM), a machine model (MM), and a charged-device model (CDM) qualification requirement in order to determine ESD-susceptibility limits and protection design evaluation. ESD voltage thresholds are dependent on the circuit parameters used in each of the models, as defined by JEDEC's JESD22-A114B (HBM), JESD22-A115A (MM), and JESD22-C101A (CDM) standards.

Caution: MOS devices are susceptible to damage from electrostatic charge. Reasonable precautions in handling and packaging MOS devices should be observed.
